Abstracts

members to choose either retail or mail pharmacy as their preferred distribution channel. METHODS: Claims (n = 168,381) submitted between April, 1, 2008 and December 31, 2008 for an employer after it began offering the same price on 90-day retail and mail maintenance prescriptions were used to calculate Medication Possession Scores (MPS), Generic Dispensing Rate (GDR), Generic Substitution Rate (GSR), and Preferred Brand Dispensing (PBDR) for patients impacted by the MDR, GSR, and PBDR were calculated for all claims with a 90-day supply. MDR was calculated for all patients who were eligible 180 days before and after their first 90-day prescription between April 1 and June 30, 2008 for each maintenance class, using that first prescription and any within the subsequent 180 days. Overall metrics and those for select classes with sufficient sample size are presented. RESULTS: The average MDR, across all classes, was 80% for retail dispensed prescriptions and 78% for mail. Among the six high-volume classes, the average MDR was 82% at retail and 81% at mail, with MPRs for individual classes ranging from 75% (PPI) to 89% (ACEs and Anti- convulsants) for retail-dispensed and 74% (SSRIs) to 85% (ACEs) for mail-dispensed. When comparing retail and mail dispensed prescriptions, GDR (57% vs. 56%), GSR (99% vs. 99%), and PBDR (86% vs. 86%) were nearly identical. CONCLUSION: When out-of-pocket costs and days supply per prescription are identical, adherence rates and related formulary performance metrics for mail and retail-dispensed maintenance medications appear essentially similar in early results. These pilot results will need to be confirmed as more payers adopt this benefit design and longer follow-up periods improve adherence measurement precision.

THE IMPACT OF MEDICARE SUPPLEMENT INSURANCE ON ACCESS, UTILIZATION, AND COST OF HEALTH CARE AND ON COMPLIANCE WITH RECOMMENDED PHARMACEUTICAL TREATMENT

Marshall Jk, Ozminowski Rj, Anderson M, Hawkins K

Ingersoll, MHN, MN, USA; UnitedHealth Group, Alliance, Ann Arbor, MI, USA; United-Health Group, MnM, MN, USA; United-Health Group, Mnl, MN, USA; United-Health Group, Mn, MN, USA

OBJECTIVES: The literature was reviewed to determine the impact of Medicare supplement insurance (i.e. Medigap) on the Medicare program with respect to access, utilization, costs, and drug compliance. Additionally, we discuss a new program to improve pharmacutical utilization for Medigap enrollees. METHODS: We conducted a literature search using PubMed, looking for peer-reviewed articles that compared access, utilization, outcomes and costs between enrollees with Medicare fee-for-service coverage alone to those with Medigap. Additional searches focused on differences in pharmacological compliance, for those with and without drug coverage, among the two groups. Finally, we searched for pharmacy compliance programs offered through supplement insurance plans. RESULTS: Twenty-seven articles met our search criteria. Literature suggests Medicare Supplement Insurance can be cost-effective, that it is correlated with better access to health care services, and may result in higher utilization of preventive services than would be the case with such coverage. Also, the type of supplement insurance did not significantly influence prescription drugs utilization among Medicare enrollees. No articles found discussed any current efforts to manage the pharmaceutical treatment of Medicare Supplement Insurance enrollees. CONCLUSIONS: Medigap programs have not historically managed their enrollees like Medicare Advantage plans have done. In particular, the literature suggests there is room for improvement in pharmacy management for all Medicare populations compared to those enrolled in Medicare plans. This has led AARP and UnitedHealth Group to offer a pharmaceutical compliance program, with disease management and case management programs, for their AARP Medicare Supplement Insurance enrollees, beginning in 2009. Results from this care management effort will help tailor models for more ways to better manage the care for fee-for-service Medicare enrollees with supplement coverage.

COMPARISON OF ADHERENCE, PERSISTENCE AND MEDICATION WASTAGE IN 30-DAY VERSUS 90-DAY REFILL CHANNELS

Van L, Zung J, Lee KY, Schumock GT, Khardelwal NG

University of Wisconsin at Chicago, Chicago, IL, USA; Walgreens Health Initiatives, Deerfield, IL, USA, Walgreens Health Services, Deerfield, IL, USA

OBJECTIVES: To compare medication possession ratio (MPR), medication persistence & pill wastage in 90-day versus 30-day refill channel among 3 different drug classes. METHODS: We conducted a retrospective study using pharmacy claim database. The cohorts were classified based on the type of refill duration (30-day or 90-day). Patients included in the study were continuously eligible in the insurance plan for the study duration and were new to therapy during the identification period (January 1, 2006 to June 30, 2006) and were followed for 21 months after their index date. Claims in the first 3-months after the index date were excluded from the analysis to avoid mortality bias. Outcomes included MPR, persistence to therapy, and pill wastage. Pill wastage was calculated only among those who switched therapy with a pharmacological class of drugs (i.e. diuretics). Therapeutic drug classes included in the study were antihypertensives (AH), anti-depressants (AD), antihyperlipidemics (AL), anti-asthmatics (AA) and anti-diabetics (AD). RESULTS: A total of 8403, 6286, 7197, 5383 and 2722 subjects in AH, AD, AL, AA and AD drug classes were included. MPR and persistency were consistently and statistically higher in the 90-day versus the 30-day duration for the 5-months and 18-months post index among all the 5 drug classes studied. There was a consistent trend of decrease in MPR and persistency at 18-months in comparison to 9-months follow up in all the 5 therapeutic drug classes studied. The higher trend in pill wastage in the 90-day versus 30-day refill channel was not consistent across all therapeutic categories. CONCLUSIONS: Members who refilled 90-day versus 30-day were associated with a significant higher MPRs and persistency. Efforts to increase medication adherence should be continued steadily along the course of therapy as a medication adherence with chronic medications continues to decrease over time.

PATTERNS OF UTILIZATION AND DISCONTINUATION OF MEDICATION IN A RETIREE POPULATION

Ohio State University, Columbus, OH, USA

OBJECTIVES: To describe the patterns of medication discontinuation in a retiree population. Premature discontinuation of medications adversely affects patients' outcomes and the average of additional health care resources. METHODS: The study included pharmacy claims from a retirement system for the period January 2000-September 2005. The unit of analysis was the course of drug therapy (CDT), representing a unique combination of a patient and a drug product (i.e. generic name, formulation and strength). CDTs initiated between August 1, 2000 and July 31, 2001 and discontinued before March 1, 2005 were included in the analysis. Days in therapy for each CDT were calculated as the difference between the date of the first and last prescription of the CDT. RESULTS: The study included 1.1 million CDTs representing 5.9 million claims. 37.0% of CDTs were discontinued with less than a month in therapy, 50.0% with less than 6 months, and 76.0% within one year. Maintenance therapy comprised 740,788 CDTs (70.3%) of which 27.0% had a single claim. Maintenance therapies had the following cumulative utilization patterns: 36.7% CDTs discontinued less than 3 months after therapy, 45.0% in less than 6 months, 50.0% within one year, and 87.2% within two years. 21.6% of non-maintenance CDTs were continued for more than a year and 11.8% for more than 2 years. CONCLUSIONS: Premature discontinuation of therapy intended for long-term use is highly prevalent with more than one-fourth of all maintenance therapies discontinued at the first prescription, and nearly three-fourths discontinued within the first 5 years of therapy. In the other hand, over one-fifth of non-maintenance therapies were used for over a year. The assessment of compliance using claims data should account for discontinuation therapy prior to the potential manifestation of positive patient outcomes and for the short-term usage of maintenance therapies and prolonged use of non-maintenance therapies.

ASSESSING THE VALUE OF LESS FREQUENT MEDICATION DOSING ON ADHERENCE AND OUTCOMES

Veemstra DS, Alfonso R, Best JH, Bruhn D, Garrison LP

University of Washington, Seattle, WA, Amylin Pharmaceuticals, Inc, San Diego, CA, US, ‘Ib Lily and Company, Indianapolis, IN, USA

OBJECTIVES: To systematically evaluate studies assessing the outcomes and economic value of decreased medication dosing frequency. METHODS: We searched the literature from 1998 to 2008 using the MEDLINE database for articles that evaluated the cost-effectiveness of dosing frequency changes and adherence. Only non-English articles were initially excluded; from the identified citations, all abstracts were reviewed; those lacking a clear link between dosage frequency changes, adherence, and cost-effectiveness (CEA) were excluded. The selected articles were thoroughly reviewed and summarized. RESULTS: A total of 168 citations were identified; after exclusions by reviewing the abstracts, 21 were selected and reviewed–18 original studies and three systematic reviews. The articles encompassed several chronic pathologies, e.g., osteoporosis (seven) and hepatitis C (two). Seven of the ten economic studies utilized decision modeling approaches (usually one-way sensitivity analyses), one used Monte Carlo simulation. The effect of dosage frequency changes on adherence was not the primary outcome. In most cases, assumptions on adherence changes were used as part of the sensitivity analysis, but lacked support from strong evidence. Only two randomized clinical trials where adherence was not the primary outcome reported the effect of dosing changes, but focused, as did cross-sectional surveys, on patient preferences instead of cost-effectiveness. Observational studies and retrospective claims data reviews used different measures, definitions, and methodologies, making it difficult to summarize their results. Overall, the studies suggested that less frequent dosing leads to improved outcomes, although direct evidence of economic benefit was often lacking. CONCLUSIONS: Due to the lack of direct evidence, head-to-head direct comparisons of dosing regimens and long-term prospective studies are ideally needed to evaluate the cost-effectiveness of less frequent dosing that may improve outcomes through improved adherence or improved pharmacokinetic/pharmacodynamic effects.

THE BRAZILIAN PORTUGUESE VALIDATION OF THE PROLAPSE – QUALITY OF LIFE QUESTIONNAIRE – P-QOL

Scarlato AF, Fonseca ES, Fonseca MCM, Muranaka AH, Sartori MG, Giro MJB, Castro RA

Federal University of Sao Paulo, Sao Paulo, Brazil; UNIFESP – Federal University of Sao Paulo, Sao Paulo, Sao Paulo, Brazil, Universidade Federal de Sao Paulo, Sao Paulo, SP Brazil

OBJECTIVES: The aim of this study was to translate and validate a Brazilian version of the “Prolapse – Quality Of Life Questionnaire” (P-QOL) as a specific instrument to assess the impact of pelvic organ prolapse on the quality of life of Brazilian women with genital prolapse. METHODS: Sixty-five patients (45 with symptomatic and 20 with asymptomatic pelvic organ prolapse), were enrolled from the outpatient clinic of the Urogynecology and Vaginal Surgery Section of the Gynecology Department of the Federal University of Sao Paulo (UNIFESP). At first, we translated the P-QOL

A167
into Brazilian Portuguese language following international methodological recom-
mandations. Because of language and cultural differences we performed cultural,
structural, conceptual, and semantic adaptation on the P-QOL, so that patients were
capable to completely understand the questions. All patients answered P-QOL twice
on different days during an interval of 30 minutes, applied in face-to-face interviews
by two different interviewers. After 7 to 15 days, by phone interview, P-QOL was applied
again. The reliability assessed using Cronbach alpha and validity was assessed
comparing symptom scores between affected and asymptomatic women and compar-
ing symptom scores with objective prolapse stages. RESULTS: The results showed that
the Brazilian Portuguese version of P-QOL has very good psychometrics properties.
The total scores for each P-QOL domain were significantly different between symp-
tomatic and asymptomatic women (p < 0.05). All items achieved a Cronbach alpha
greater than 0.70 showing moderate to good inter-observer reliability. The test-retest
reliability confirmed a highly significant correlation between the total scores for each
domain. CONCLUSIONS: P-QOL was cross-culturally adapted and validated for
Brazilian women with genital prolapse, showing good reliability and validity. The
Brazilian Portuguese version of P-QOL is a good option for Brazilian researchers to
evaluate the quality of life in women with pelvic organ prolapse.

DEVELOPMENT OF A SPECIFIC QUESTIONNAIRE ASSESSING THE
IMPACT ON PARENTS OF AN INFANT’S BRONCHIOLITIS
HOSPITALIZATION
Lapillonne A1, Goury V1, Guigon J2, Blirotte C3, Benmedjed K4, 
Koboré I1, Clémens A5, Aouad B6, Berjenana H7. 
1Saint Vincent de Paul Hospital, Paris, France; 2University Hospital (CHU) of Nantes, Nantes
Cedex, France; 3University Hospital (CHU) of Dijon, Dijon, France; Yport- Royal Hospital, Paris,
France; 4Mapi Values France, Lyon, France; 5Mapi Values, Lyon, France; 6Abbott Laboratories,
Rungis, France.
OBJECTIVES: To develop a questionnaire assessing the impact on parents of an infant’s hospitalization for bronchiolitis. Bronchiolitis is a viral respiratory infection of
the bronchioles most commonly caused by the respiratory syncytial virus. It usually
affects infants of less than 2 years, particularly following premature delivery; bron-
chopulmonary dysplasia or congenital heart disease. Although generic questionnaires
about the impact of a child’s disease on family are available, no specific questionnaire
linked to bronchiolitis hospitalization exists. METHODS: A multidisciplinary scien-
tific committee was set up and included in the whole process of questionnaire develop-
ment. A literature review, 3 clinician interviews and 18 exploratory interviews with
parents of children hospitalized for bronchiolitis were conducted in parallel. The
corresponding items were identified and organised into a model. Items were generated for each concept using parents’ words. The Impact of Bronchiolitis Hospitalization Questionnaire
(IBHQ) was developed in French to be completed by the parent who was the most
often present at the hospital, within the seven days after bronchiolitis hospitalization,
and again three months after hospitalization. The IBHQ® was tested for relevance and
comprehension with nine new parents, and revised accordingly. RESULTS: Items generated for each concept identified were organised into eight sections: parents’
emotional impact, infant’s reactions, parents’ physical impact, impact on daily orga-
nization, siblings’ reactions, parents’ behaviour with infant and siblings, impact on
independence and financial consequence. Among these items that were modified or deleted
following parents’ suggestions, most of the items were well understood, and consid-
ered relevant and adequate by parents during comprehension tests. The revised
IBHQ® contains 65 items. CONCLUSIONS: The IBHQ® is a unique and promising
tool that provides a comprehensive evaluation of the impact of a child’s bronchiolitis
hospitalization on parents. An observational study is currently under way to validate
psychometric properties and scoring of the questionnaire.

URNARY URGENCY INTENSITY RATING IN RELATION TO SYMPTOM
FREQUENCY, BOTHER, AND TREATMENT SEEKING: RESULTS FROM
EPILOTS IN THE US, UK, AND SWEDEN (SE)
Kramers LA1, Coyne KD2, Sexton C2, Kopp Z2.
1United Biotalle Corporation, Bethesda, MD, USA; 2Pfizer, New York, NY, USA.
OBJECTIVES: Overactive bladder (OAB) is characterized by urinary urgency (U),
with or without urgency incontinence (UIC), typically with frequency and nocturia.
As urinary urgency is highly subjective and difficult to assess, we examined the rela-
tion of urgency intensity with symptom frequency, symptom-specific bother, and
treatment seeking to better understand urinary urgency. METHODS: This cross-
sectional, population representative survey of men and women age 40 and older was
conducted via the Internet in the US, UK, and SE. Participants were asked to rate how
often they experienced urinary symptoms during the past four weeks using a 5-point
Likert scale. Urgency intensity was rated using a 10-point numerical rating scale.
ANOVA was used to assess urgency intensity by frequency and bother levels. Logistic
regression was used to assess treatment seeking and urgency intensity while controlling
for demographics and medical comorbidities. RESULTS: Overall response rate was
52.9%; of the 30,000 who participated, about half of men (n = 7172) and 65% of
women (n = 9987) reported UU at least “rarely” or more often. Mean ages were
58.4 (men) and 57.3 (women), and about 80% were white. Urgency intensity increased in
relation to symptom frequency and symptom-specific bother for both men and women.
Even after controlling for covariates, intensity of UU was significantly (p < 0.0001)
associated with treatment seeking. CONCLUSIONS: Urgency rating increases with both
UU frequency and bother for both men and women. Higher levels of urgency intensity increase the likelihood of seeking treatment.

PH38
STATISTICAL ANALYSES OF FACTORS AFFECTING LENGTH OF STAY AND
TOTAL CHARGES FOR PEDIATRIC PATIENTS AFFLICTED WITH
PERINATAL INFECTION
Tran PL.
University of Louisville, Louisville, KY, USA.
OBJECTIVES: Infants are vulnerable to sexually transmitted diseases due to the major
long-term health problems infected mothers can transmit to newborns, i.e. perinatal
infection. Some experts say there is insufficient or unreliable data regarding the treat-
ment for infants diagnosed with perinatal infection. Therefore, this study aims to
explore a national data set of perinatal infection inpatients for trends that may be
useful towards improving the efficiency and quality of perinatal treatment and manage-
ment. METHODS: Provided by the National Inpatient Sample, the study’s data consisted of
30,000 infants with and without perinatal infection. It was released in 2007 and reflects a
2003 sample collected from more than 100 hospitals and
